

Trees play an important role in an ecosystem by maintaining ecological balance and equilibrium. Trees hold the soil in which they grow. As a result the fertile top soil is held securely; otherwise it may get drained or washed away in water such as during rains and floods. Trees are the natural habitat for many wildlife species that includes mammals, birds, reptiles and insects. Trees play a vital role in climate. A micro-habitat formed by planting trees can create a green and natural area, and a micro-climate that is healthy for all the life forms, including man, that inhabit the area

Trees are crucial to our life. Trees give us oxygen which we need to breathe. The different parts of trees, such as roots, leaves, flowers, fruits and seeds, are also food for man and other herbivores. Trees are home to birds as also to animals. Trees maintain balance in our ecosystems. By cutting trees we destroy our environment.

It is very important to save trees. Planting trees helps in increasing the green cover of the Earth, and improve the environment. Planting trees in our house or in our neighborhood make us enjoy the beauty of the greenery, and revel the moment of the birds and butterflies that visit on the trees.

Tree plays a significant role for all of us as well as for animals, insects, birds etc. As we know the famous phrase "Save trees, Save life". So, we acknowledge it and be a part of the plantation.

Trees are important for life on Earth. Trees give us shade. Trees give beauty to any place. Trees bear beautiful and colourful flowers.

Trees are home to many animals, birds and insects. When trees are cut, these creatures lose their home.

Trees are also food for man, and all herbivorous animals and birds. Insects also depend on trees to complete their life cycle

Trees are of great ecological importance. The hydrological cycle is dependent on trees. Trees and forests help in maintaining monsoon cycles and rainfall patterns. They also bind the soil, and prevent the top layer of the soil, which is the most fertile, from getting washed away in rains and floods.

The process of photosynthesis in trees uses up carbon-dioxide from and releases oxygen into the air. Trees, thus, provide us the oxygen that we depend on to breathe and live. By consuming the carbon-dioxide in the air trees also help in checking the level of the greenhouse gas in the air. This helps in keeping global warming under control.

As trees are important for Planet earth and the environment, we must protect them. Tree plantation is an important activity to make our environment green, clean and healthy
