Topic: Harmful effects on Chemical fertilizers  
In contrast, with the usefulness at the time  
They were found.

First of all, I would like to talk about the Great Famine. In the mid 19's, there was a time when our country, India, when the farmers couldn't feed the large population, with the limited agricultural land with only naturally available manure.

It was at this time, when M.S. Swaminathan founded & introduced the HYV's (High Yield Variety) seeds and chemical fertilizers. Due to this very invention, we were made ready to feed the population.

But this running time, the use of these fertilizers increased heavily, causing agricultural land to deplete heavily, which is a major concern at this time.

Due to this we are facing many problems, which we are suffering to sustain. I would like to promote the farmers to stop the use of them. They should save land and save lives of people.
